Files Are Digitally Signed Tool

Files are digitally signed tool allows you to verify that a digital signature is present for any given file and view its details. This can be achieved either via a .csv output file generated via command line or by a UI.

It is important to set up the config file correctly before using the program

```
<fileNames>
  <add key="0" value="C:\test1.exe" />
  <add key="1" value="C:\test2.dll" />
 </fileNames>
```

The .csv export can be generated by calling the application with any parameters, eg:

"FilesAreDigitallySignedTool.exe -export"

The export can then be found in:
<MyDocs>\Tools\FilesAreDigitallySigned\results.csv

Note that if a results file already exists, then the output filename will be results2.csv, results3.csv etc.
